

# MODEL 610 TRACKDOWN TESTER

---

---

## FEATURES:

- **Companion instrument to the Scully Universal Truck Tester. The 610 is used to track down fault locations in two and five wire optic retain/overflow probe systems on trucks.**
- **When the probes are energized by a Scully Universal Tester or an Intellicheck™, the 610 is used to trace the voltage and pulse signals throughout the probe system to determine the exact fault location. It is not necessary to disconnect the probes from the system.**
- **Drastically reduces troubleshooting time and trailer downtime.**
- **The probe performance can be tested under exactly the same operating conditions as they encounter at the loading rack, ensuring reliable and accurate testing.**
- **Three level color coded signal indicators distinguish marginal probes or wiring, and automatically distinguish between the power and signal wires.**
- **Inexpensive, easy to obtain batteries - operates from four 'C' cells giving over 200 hours of battery life. There is no change in performance as the batteries age - the display shuts off when the batteries are exhausted.**
- **Durable, rustproof, and weatherproof enclosure. The test leads are durable and highly flexible, even at -40 °C, and come equipped with alligator clips for easy use.**
- **Operation from -40 °C to +50 °C for continuous outdoor use.**
- **Easy to operate - instructions are on the front panel label. The tester comes equipped with an operation and troubleshooting guide.**
- **Two year warranty.**
